Ever After — User Testing Checklist

Purpose: end-to-end testing of the wedding platform on the free hosted environment before commercial launch. Work through each section in order — later sections build on earlier ones.

Test site: `<paste Vercel URL here>`

Test window: `<start date>` → `<end date>`

How to report: for every issue, send (1) what you clicked, (2) what you expected, (3) what happened instead, (4) a screenshot, (5) your device + browser (e.g. "Android + Chrome", "iPhone + Safari", "Windows + Edge").

> **Testers, please read first:** invitation/RSVP-reminder *emails and SMS
>
> are disabled* in this environment — nothing is actually sent. Wherever a
>
> step says "send", copy the **shareable link** from the dashboard instead
>
> and open it in a private/incognito window to act as the guest. PDF
>
> downloads are replaced by **Print via preview** on this host (by design).
>
> Scheduled messages go out **once daily**, so use the **"Deliver due now"**
>
> button when testing reminders.

Part A — The couple (dashboard, desktop or tablet)

A1. Account & wedding setup

- ☐ Register a new account (email + password, 8+ characters).
- ☐ Verify the email, then sign in.
- ☐ Create a wedding: title, URL slug (lowercase + hyphens), timezone.
- ☐ Open the wedding hub — all 16 section cards load (Events … Settings).
- ☐ Invite a second tester as **planner** via Team (email + role).
- ☐ Second tester registers/signs in with that email → gets access automatically (pending invite disappears from the hub).
- ☐ Try opening another wedding's URL while signed in → access denied.

A2. Events

- ☐ Add 3+ events (e.g. Ceremony, Reception, After Party) with date, time,

venue, address, dress code, description.

- ☐ Mark one event RSVP-required and one invite-only/hidden as needed.
- ☐ Edit an event (change time/venue) and confirm the public site updates.

A3. Guests & households

- ☐ Create a household (e.g. "The Rahman Family").
- ☐ Add guests: an individual, a couple, a family with a child (child flag), and one guest with plus-one allowed.
- ☐ Tag a guest (e.g. VIP), add a private note, set a non-English language for one guest.
- ☐ Assign different guests to different events.
- ☐ Search and filter the guest list; check the guest statistics.
- ☐ Import 2–3 guests via CSV; export guests to CSV/XLSX and open the file.

A4. Design & invitation builder

- ☐ Pick a theme (try 2–3), customize a color/font, persist across reload.
- ☐ Toggle light/dark mode — every page should remain readable.
- ☐ Design the monogram (initials + style + shape) and confirm it appears on the invitation preview and the website hero.
- ☐ Reorder website sections and disable one; preview updates.
- ☐ Upload a cover photo (and a short video if available).

A5. Website & publishing

- ☐ Fill in story, venue/travel/accommodation, menu, FAQ, registry note.
- ☐ Open the dashboard **Preview** — it shows live content (guestbook entries, songs, games, welcome video), not empty placeholders.
- ☐ **Publish** the site → open `/w/<slug>` in an incognito window.
- ☐ Confirm the disabled section is hidden and everything is mobile-sized.
- ☐ Unpublish → public URL shows nothing; re-publish.

A6. Invitations & RSVP (couple side)

- ☐ Generate invitation links for 2 guests (different events/language).
- ☐ Open guest A's link in incognito → only A's events show, in A's language. Editing the URL must **never** reveal guest B.
- ☐ RSVP dashboard shows responses and statistics after guests reply.

A7. Messages

- ☐ Compose a save-the-date and an invitation (preview first, confirm checkbox, then schedule/send).
- ☐ Schedule an RSVP reminder for 5 minutes out → **Deliver due now**.

☐ Check delivery history (status, sent time, errors), cancel a scheduled message, retry a failed one.

A8. Registry

☐ Add a physical gift (quantity 2), a cash fund, and an experience.

☐ Publish → claim one unit as a guest (incognito) → totals update.

☐ Have two testers claim the last unit **at the same time** → exactly one succeeds; the other sees "fully claimed"; total never exceeds 2.

A9. Seating, budget, vendors, checklist

☐ Create tables with capacities; drag guests onto seats.

☐ Confirm over-capacity warning, unassigned list, and seating lookup.

☐ Seed the **starter budget** from the wedding date; add one expense.

☐ Add a vendor with cost; record 2 installment payments → paid total and status update; export vendors + payments.

☐ Generate the starter checklist from the wedding date; move a task to done.

A10. Guest engagement (moderation)

☐ As a guest (incognito): sign the guestbook, request a song, upload a photo, answer a quiz question, seal a time-capsule note.

☐ As the couple: approve/reject each from **Engage**; approved items appear publicly, rejected ones never do.

☐ Add a quiz game with 2 questions (one with a correct answer) → guests can vote and see live results.

☐ Hide a game (Show/Hide toggle) → it disappears from the public site.

A11. Stationery & exports

☐ Preview invitation, save-the-date, place cards, menu, thank-you card, seating chart (HTML preview + browser print).

☐ Export RSVP, seating, dietary, budget, tasks (CSV and full XLSX).

Part B — The guest (phone, incognito/private window)

☐ Open your personal invitation link → names, events, and language are yours (try `?lang=bn` / `?lang=ar` on the website URL too).

☐ RSVP **attending** to one event and **declined** to another; add a plus-one name where allowed; record dietary needs + an allergy.

☐ Change your RSVP afterwards (before the deadline).

☐ Try RSVP **after** the couple sets a past deadline → blocked politely.
☐ Registry: reserve a gift and contribute to a fund.
☐ Guestbook, song request, photo upload, quiz vote, capsule note.
☐ Everything readable with one thumb, no horizontal scrolling, buttons big enough to tap.

Part C — Day-of staff (tablet or phone)

☐ Staff member signs in and opens **Day-of**.
☐ Search a guest by name → check them in → attendance counter moves.
☐ Check in the same guest twice → no duplicate, no error.
☐ Undo a check-in → counter moves back.
☐ Scan a guest's QR code from their invitation to check in.
☐ Look up seating + dietary flags for a guest at the door.
☐ Post an announcement; confirm it shows on the staff board.
☐ Open the vendor contacts list and the event schedule.

Part D — Cross-cutting (everyone)

☐ Switch the website language (footer switcher): dates, numbers, and labels localize; try an RTL language (Arabic/Hebrew) — layout mirrors.
☐ Keyboard-only pass on RSVP form: Tab reaches every field, Enter votes.
☐ Reload mid-flow (RSVP half-filled, dashboard forms) — no data loss worse than retyping the current field.
☐ Note any page that takes longer than ~3 seconds on mobile data.

Appendix — please do NOT report these (known test-env limits)

- No real emails/SMS arrive (providers unwired) — use shareable links.
- "Download PDF" is replaced by "Print via preview" on this host.
- Scheduled messages dispatch once daily, not instantly.
- Two testers clicking the exact same millisecond may see last-write-win on RSVP edits (by design at this scale).
- Dashboard pages beyond the hub are English-only; guest surfaces are fully translated.
